

Appendix C-2: The Robustness of Results to Alternative Dynamic Specifications (Full Results)

Notes: The B&K method uses pooled OLS with a LDV and PCSE's. It should be noted that in their initial studies, Cox et al. (1998) and Zahariadas (2001) did not use PCSE's and Saideman et al. (2002) also used the Prais-Winston in addition to the basic B&K method; however, to be consistent we used the B&K method when performing replications for this table. Also, note that our "original results" for Saideman et al. are slightly different than what the authors report in their paper. After dropping the observations with missing data, we had a few less observations than they use in their reported models. We felt justified in including their article in this study despite that discrepancy because the results are not different in any significant way from what they report. We tested the robustness of the B&K method results by running 5 other model specifications: pooled OLS without the LDV, Prais-Winston without the LDV, lagged independent variables (LIV's), LIV's and LDV, first-difference model. We used PCSE's in all of the models.
